---

Professional Summary

Junior software developer and data-minded technologist with hands-on experience building production Python systems, from point-of-sale and inventory platforms to logistics data workflows. Combines solid engineering fundamentals (Flask, SQLite, JWT authentication, cloud deployment) with an analytical approach to marketing and operations data, plus self-directed training in network security and OpSec using tools like Wireshark and Nmap. Comfortable owning a project end-to-end — from architecture and coding to deployment and iteration under real business constraints.

Technical Skills

Languages & Frameworks: Python, Flask, HTML, CSS, JavaScript, tkinter, JWT Authentication
Data & Analytics: SQLite, data processing and integrity management, performance optimization, campaign/sales metrics analysis
Security & Network Tools: Wireshark, Nmap, operational security (OpSec), network traffic analysis

Cloud & Deployment: Railway, Render, DigitalOcean
Operating Systems: Windows, Ubuntu, Kali Linux

Professional & Freelance Experience

Freelance Software Developer — East Africa Packaging Hub | Nairobi, Kenya

- Architected and built a Python-based Point-of-Sale system from the ground up, evolving it from an initial Flask/SQLite prototype into a full production platform with dual wholesale and retail pricing, live inventory management, and JWT-based multi-user authentication.
- Deployed and maintained the system across multiple cloud platforms (Railway, Render, DigitalOcean) to ensure reliable uptime for daily business operations.
- Extended the platform with a real-time GPS delivery tracking system integrated with M-Pesa STK Push for mobile payments, streamlining order fulfillment from sale to delivery.
- Delivered a standalone offline desktop POS (tkinter + SQLite) covering the full product catalog, giving the business a reliable fallback during connectivity outages.
- Maintained and extended a large, single-file production codebase (~3,300 lines) through careful, targeted changes to avoid disrupting live business operations — including thermal receipt printing and label printing features.

Freelance Web Developer — Danny Consultancy | Remote

- Designed, built, and deployed a professional corporate website for a consultancy client, translating brand and business requirements into a functional, responsive site.

- Managed the project independently from requirements gathering through deployment, coordinating directly with the client on design and content decisions.

Digital Marketing Agent & Analyst — Makena Herbs | Remote

- Managed the brand's social media presence and day-to-day digital marketing execution.
- Tracked and analyzed sales and engagement metrics to evaluate campaign performance, using the findings to guide content and channel strategy.
- Acted as the analytical link between marketing activity and sales outcomes, helping the business understand which campaigns were actually driving results.

Data Analyst / Operations — Pace Riders Logistics | Nairobi, Kenya

- Managed and processed high-volume delivery and logistics data to support day-to-day operational decisions.
- Maintained data integrity across delivery records, identifying and correcting discrepancies that could disrupt tracking accuracy.
- Analyzed operational data to surface bottlenecks in logistics workflows and support process improvements.

Independent Security Enthusiast — Self-Directed

- Self-taught operational security (OpSec) principles and network auditing techniques, building practical skills with industry-standard tools including Wireshark and Nmap.
- Practiced network traffic analysis and vulnerability identification in personal lab environments as ongoing professional development toward a cybersecurity specialization.

Key Projects

EAPH POS & Inventory System (Python, Flask, SQLite, JWT) — Production point-of-sale platform for a retail/wholesale packaging business, with GPS delivery tracking and M-Pesa payment integration. [github.com/macrya]

FinanceTracker (Python) — Personal finance tracking application.

OBD-Reader (Python) — Tool for interfacing with vehicle OBD-II diagnostics.

GarageManager (Python) — Inventory/management application.

(Note: a few repositories on your GitHub — FinanceTracker, OBD-Reader, GarageManager, StockApp — don't yet have descriptions. A one-line summary of what each does and the problem it solves would let us turn these into stronger, more specific bullet points.)

Education & Certifications

Diploma in Computer Science — Zetech University *(Awaiting Graduation)*

Python Programming Bootcamp Certificate — Jomo Kenyatta University of Agriculture and Technology (JKUAT) *(Started January 2024)*
